EDUCATION

University of Texas Rio Grande Valley

Bachelor of Science, Computer Science | 3.7 GPA

Edinburg, Texas

December 2027

Relevant Coursework: *Algorithms & Data Structures, Computer Organization, Object-Oriented Programming, Software Engineering, AI Agent Programming, Database Implementation, Computer Networks*

Experience

JPMorgan Chase – Software Engineer

Plano, TX

Internship | Java, Spring Boot, SQL/JPA, Kafka, REST API

Summer 2026

- Built and deployed production Java/Spring Boot REST APIs that automated failed-transaction recovery, replacing manual remediation while preserving data integrity across concurrent services.
- Designed SQL/JPA repositories and data-access layers to query, update, and audit transaction records, giving enterprise applications end-to-end traceability.
- Shipped a production feature from design through deployment in a large microservice codebase: implemented backend services, debugged and UAT-tested them, and supported production releases.

Projects

Skillcast (Roger)

2026 – Present

Software Engineer | Rust, TypeScript, Node, Electron, SQLite

- Own the Rust capture core of a local-first macOS agent used by ~200 people: a real-time event pipeline that coalesces raw keystrokes into semantic events and commits them to an append-only SQLite write-ahead log.
- Replaced a 300 ms polling thread with an event-driven kqueue (EVFILT_VNODE) watcher, cutting ~3.3 idle wakeups/s to zero and removing steady-state CPU load from the daemon's health path.
- Enforced privacy at the capture edge (app denylist, secure-field masking, PII redaction before any write) so cleartext never reaches disk; verified with 130+ Rust and TypeScript unit/integration tests.

Satellite Telemetry Ground Station

2026

Independent Project | C++20, Linux, UDP/POSIX Sockets, epoll, Multithreading, GoogleTest, CMake

- Built a C++20 Linux ground station that ingests simulated satellite telemetry over UDP via a custom binary protocol (sequence numbers, CRC-32), detecting dropped, duplicate, and out-of-order packets.
- Designed a multithreaded pipeline, a non-blocking epoll receive thread feeding worker threads through a lock-free single-producer/single-consumer ring buffer, sustaining 500K+ packets/s at under 50 μ s p99 latency.
- Validated behavior on degraded links by injecting 5% packet loss and jitter with Linux tc netem; debugged race conditions with ThreadSanitizer and covered protocol parsing with 40+ GoogleTest unit tests.

JPMorgan Chase Code for Good

Fall 2026

Hackathon | React/Next.js, Python, Flask, Gemini API, REST

Plano, Texas

- Won 2nd place building a full-stack web app for the Blackheart Association: secure authentication/authorization and a real-time resource-management dashboard (React/Next.js, Flask REST API).
- Integrated the Gemini API to drive AI recommendations for nonprofit resource allocation.

Small Language Model from Scratch

2026

Independent Project | Python, PyTorch

- Implemented a decoder-only transformer from scratch (tokenizer, multi-head attention, training loop) and tuned context length, embedding size, and learning rate against validation loss.

TECHNICAL SKILLS

Languages | C++, Rust, Python, Java, TypeScript/JavaScript, SQL

Systems | Linux, POSIX sockets (TCP/UDP), epoll/kqueue, multithreading & concurrency, SQLite, Kafka

Frameworks & Tools | Spring Boot, Node.js, React/Next.js, Flask, PyTorch, CMake, GoogleTest, Git
